1. What is IBM Bob?

IBM Bob is an agentic AI platform designed to transform unstructured enterprise repositories into actionable intelligence, automated responses, and structured workflows. Unlike simple search engines or conversational chatbots, Bob functions as an autonomous reasoning agent that can investigate large document collections, cross-reference multiple conflicting sources, synthesize findings, and produce finished, evidence-backed deliverables.

2. Key Functional Capabilities

- **Autonomous Knowledge Synthesis:** Reads across dozens of past RFPs, security whitepapers, product manuals, and case studies stored in Box to assemble complete proposal responses.
- **Deterministic Evidence Attribution:** Links every extracted claim, metric, and paragraph directly to its original source file in Box with page-level citations.
- **Multi-Modal Document Parsing:** Processes complex tables, embedded charts, forms, and multi-column layouts across PDF, Office, and scanned documents.
- **Interactive Simulator & Prototype Builder:** Converts customer requirements into functioning workflow prototypes and validation checklists in seconds.
- **Model Context Protocol (MCP) Integration:** Communicates seamlessly with Box and other enterprise systems using open, standardized agent protocols.

3. Admin & Governance Controls

IBM Bob Enterprise provides comprehensive administrative controls including spending limits, role-based access management (User vs. Admin), team budgeting, audit logging, and private tenant isolation.
